L'apathie et les troubles émotionnels dans la maladie de Parkinson et la schizophrénie

Abstract:

We propose to review the current literature about emotional disorders and their link to apathy (defined by lack of motivation) in neuropsychiatric disorders. We further propose to have a deeper insight into the relationship between apathy and emotional facial recognition within Parkinson's disease and highlight the cerebral structures involved. We also propose to use an innovative skin conductance recording (SCR) deconvolution technique to test whether apathy is related to tonic SCR activity during joy induction in schizophrenia.
